

Shanti Asih Homestay

Web Programming Mini Project — Frontend Booking Website

UBUD, BALI

FRONTEND ONLY

Project Overview

This project is a website that simulates a homestay booking system, designed to give users a realistic experience of exploring and booking a stay at Shanti Asih Homestay in Ubud, Bali.

Explore Rooms

Help users browse and discover available rooms with images, descriptions, and pricing.

Booking Simulation

Provide a realistic booking flow with form validation and date logic.

Simple UX

Improve user experience through clean, intuitive web interaction.

Main Features & Pages

Key Features

- Search Room — filter and find the perfect room
- Room Detail Page — view images, description, and price
- Booking Form with Validation — real-time error checking
- Location Information — embedded Google Maps integration

Website Pages

- Homepage — hero section, about, facilities, and location
- Rooms Page — searchable grid of available rooms
- Detail Page — individual room showcase
- Booking Page — complete reservation form

Shanti Asih Homestay

Pengalaman menginap tenang dan nyaman di jantung Ubud

[Lihat Kamar](#)

Homepage Design

The homepage serves as the welcoming entry point for visitors, featuring a clean and minimal layout that highlights the beauty of Shanti Asih Homestay.

Hero Section

A full-width hero with the homestay title and a clear call-to-action button inviting users to explore rooms.

About & Information

A section introducing the homestay's story, atmosphere, and what makes it special in Ubud.

Facilities Section

A visual overview of amenities such as Wi-Fi, pool, parking, and more.

Location Section

Embedded Google Maps showing the homestay's position in the heart of Ubud, Bali.

Rooms & Detail Page

Rooms Page

The Rooms Page allows users to browse all available accommodations with a dynamic search and filter experience.

- Search bar for quick room lookup
- Room cards displayed in a responsive grid
- JavaScript-powered filtering by type or price

Detail Page

Each room has its own dedicated detail page for a deeper look before booking.

- Large room image gallery
- Description and nightly price
- List of room-specific facilities

Isi data berikut untuk melakukan reservasi di Shanti Asih Homestay.

Nama Lengkap

Wayan Raditya Putra

Email / Nomor HP

radityaputraa1122@gmail.com

Tipe Kamar

Pilih tipe kamar

Tipe kamar wajib dipilih.

Nomor Kamar

Standard Room 3

Tanggal Check-in

14/04/2026

Tanggal Check-out

25/04/2026

Jumlah Tamu

1

Catatan Tambahan

Ingin dekat kolam renang

The booking page is the core interactive feature of the website, guiding users through a seamless reservation process.

Form Input

Fields for guest name, contact info, check-in date, check-out date, and number of guests.

Error Messages

Clear, contextual error messages guide users to correct any issues before submission.

Real-Time Validation

Each input is validated as the user types, with error messages displayed directly beneath the relevant field.

Booking Simulation

Upon successful validation, a simulated booking result is displayed confirming the reservation details.

Wireframe Concept

The wireframe concept focuses on structured layout, clarity, and usability — ensuring every section of the website has a clear purpose and consistent navigation throughout.

1 Structured Layout Using Sections

Each page is divided into logical sections — hero, content, facilities, and footer — for easy scanning.

2 Focus on Clarity & Usability

Design decisions prioritize readability, intuitive navigation, and a frictionless user journey.

3 Consistent Navigation

A unified navbar appears across all pages, helping users move between sections effortlessly.

Implementation

The website is built entirely on the frontend using modern web technologies, focusing on clean code and responsive design.

HTML

Semantic HTML structure forming the backbone of every page.

CSS & Bootstrap

Custom CSS combined with Bootstrap for responsive, polished styling.

JavaScript

Dynamic interactivity including search, filtering, and form validation.

Frontend Only

No backend — all logic is simulated client-side for demonstration purposes.

Booking Logic

The booking logic ensures a reliable and user-friendly reservation experience by enforcing data integrity at every step of the process.

- All required fields must be filled before submission
- Check-out date must be after check-in date
- Real-time error messages appear instantly under each field
- A success result is displayed once all validations pass

Conclusion

This mini project successfully demonstrates the core principles of frontend web development through a practical, real-world booking website scenario.

✓ Booking Website Built

A fully functional frontend booking website for Shanti Asih Homestay was successfully developed.

⚙️ Core Features Implemented

Search, room details, form validation, and booking simulation are all working as designed.

📖 Skills Gained

Improved understanding of HTML, CSS, Bootstrap, and JavaScript in a real project context.
